Name: _____

Keeping Food Safe

A food-borne illness is sickness caused by eating food or drinks that carry germs or harmful things. Young children, older adults, pregnant people and people who are already ill get sick most easily.

There are three kinds of hazards. Biological hazards are germs like bacteria and viruses. Chemical hazards are things like cleaners and sanitizer. Physical hazards are objects like hair, glass or a bandage that fall into food. Cross-contamination happens when germs move from one food or surface to another, like raw chicken juice dripping onto lettuce.

Clean hands are the best way to stop germs. Wet your hands, add soap, scrub for 20 seconds (sing the ABC song), rinse and dry with a paper towel. Wash after using the restroom, after touching raw meat and before putting on gloves. Never wipe your hands on your apron.

Germs need FATTOM to grow: Food, Acid, Time, Temperature, Oxygen and Moisture. Foods like milk, meat, eggs and cooked rice are TCS foods (Time/Temperature Control for Safety). The Temperature Danger Zone is 41°F to 135°F. Keep cold food at 41°F or colder and hot food at 135°F or hotter, and check the inside with a food thermometer.

Cook poultry to 165°F, ground beef to 155°F, and steaks, pork and fish to 145°F. Thaw food in the refrigerator, under cold running water, or in the microwave if you will cook it right away, never on the counter. Clean surfaces with soap and water, then sanitize them.

Check your reading

1. Name the three kinds of hazards and give an example of each.
Biological (germs), chemical (cleaner), physical (hair, glass, bandage).

2. What is the Temperature Danger Zone?
41°F to 135°F, where germs grow fastest.

3. Give one safe way to thaw food.
Refrigerator, cold running water, or microwave if cooked right away.
