🥨 Yeast Breads: Reading · ANSWER KEY

Culinary 1 · Unit 4 · Level 3 (closer to the class work) · goes with Yeast Breads (yeast slides and KitchenAid Mixer PowerPoint)

Name: _____

Yeast Breads

Yeast is a tiny living thing. When it eats sugar, it makes carbon dioxide gas, and the gas makes dough rise. Pizza dough, pretzels, dinner rolls and cinnamon rolls are yeast breads.

Yeast wakes up in warm water, about 110°F to 120°F. Water that is too hot kills the yeast, and water that is too cold keeps it asleep. Sugar is food for yeast. Do not put salt right in the yeast water, because salt slows or kills yeast.

Gluten is the protein in flour that makes dough stretchy. Bread flour has more protein than all-purpose flour, so it makes chewier bread. To knead means to push, fold and turn the dough so the gluten gets strong. To proof means to let the dough rise.

The stand mixer has three tools. The dough hook kneads bread dough. The flat beater mixes and creams. The wire whip whips air into eggs and cream. Always lower the bowl or lift the head and turn the mixer off before you touch the tool.

For pretzels: dissolve the yeast in warm water, add the flour and salt and knead, let the dough rise, roll ropes and shape, then dip in a baking soda bath and bake.

Check your reading

1. What does yeast need to grow?
Warm water (110-120°F), food (sugar) and time.
2. Why do we knead bread dough?
To make the gluten strong and stretchy.
3. Which mixer tool kneads dough?
The dough hook.
