🥚 Milk, Dairy & Eggs: Reading · ANSWER KEY

Culinary 1 · Unit 9 · Level 3 (closer to the class work) · goes with Milk, Dairy & Eggs Unit + Protein & Eggs (PowerPoints)

Name: _____

Protein, Milk, Eggs and Cheese

Protein builds and repairs your body. Amino acids are the building blocks of protein. A complete protein has all the amino acids your body needs; it comes from animal foods like eggs, milk, meat and fish.

An egg has parts. The yolk is the yellow part. The albumen is the egg white. The chalazae are cords that hold the yolk in the middle. The air cell is a pocket of air at the big end. Shell color comes from the breed of the chicken, not the nutrition.

Store eggs in the refrigerator with the pointy end down. A fresh egg sinks in cold water; an old egg floats because its air cell is bigger. Cook eggs until the white and yolk are firm, or to 160°F in dishes like scrambles.

Eggs have jobs in recipes. They bind (hold food together, like in meat loaf), thicken (like in pudding) and leaven (help food rise, like German pancakes). A poached egg is cooked in simmering water. Eggs can be cooked many ways: scrambled, fried, poached, hard-cooked, an omelet and more.

Pasteurized milk has been heated to kill germs. Homogenized milk has its fat broken into tiny pieces so the cream does not rise to the top. Cheese is made when milk separates into solid curds and liquid whey.

Check your reading

1. What are three jobs eggs do in recipes?
Bind, thicken, leaven.

2. How can you tell if an egg is fresh?
It sinks in cold water.

3. What is the difference between pasteurized and homogenized?
Pasteurized is heated to kill germs; homogenized has fat broken up so cream doesn't rise.
